The multiscale challenge in reservoir rock

Getting answers across ≥ 8 orders of magnitude

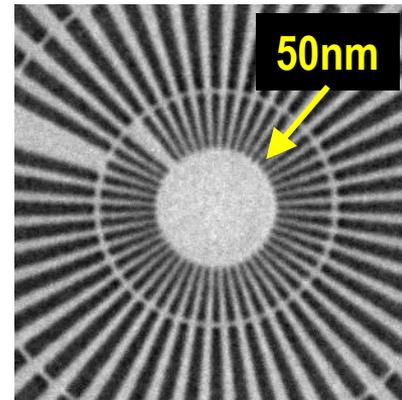

Ultra X-Ray Microscope (XRM)

3D X-ray Nanotomography down to 50 nm Resolution

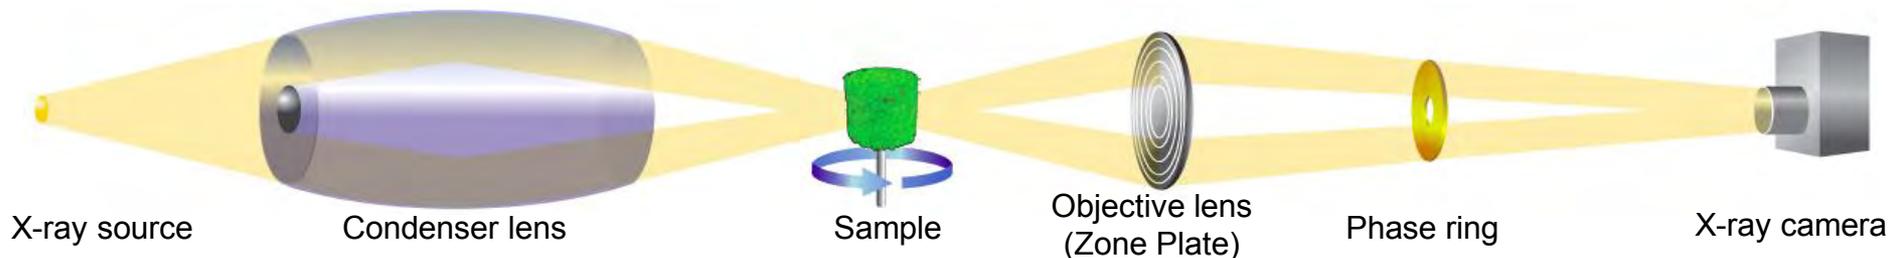

The only non-destructive, laboratory based 3D imaging solution with resolution down to 50 nm: Ideal for 4D and *in situ* studies

- High brightness X-ray source
 - **810 Ultra: 5.4 keV**
 - **800 Ultra: 8.0 keV**
- 50 nm spatial (16 nm voxel) resolution
- Advanced X-ray optics
- Absorption and Zernike phase contrast

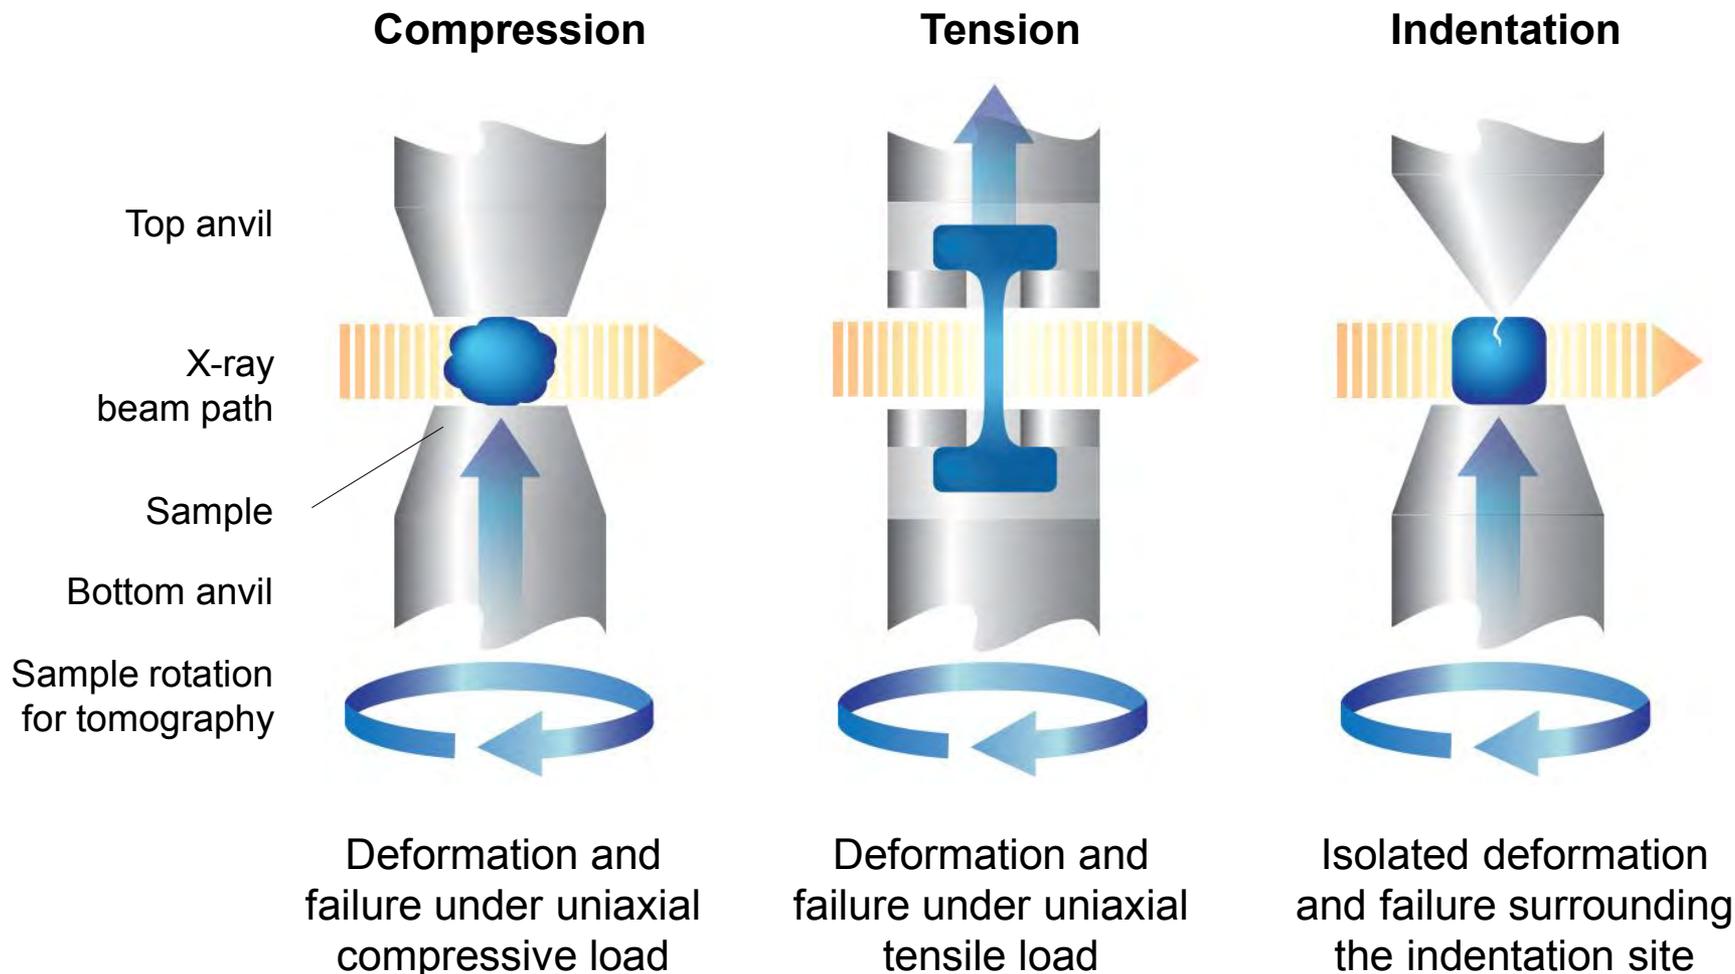

Mode	Mag	2D Res	Voxel	Field of View
Large Field of View	200X	150 nm	64 nm	65 μm x 65 μm
High Resolution	800X	50 nm	16 nm	16 μm x 16 μm

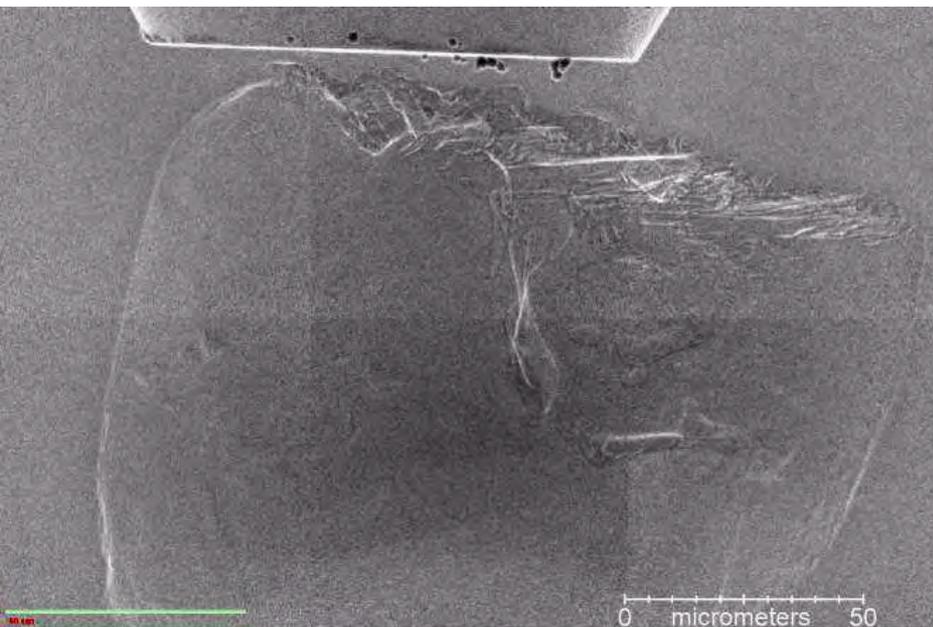

Ultra XRM Load Stage

Enables unique 3D imaging of nanostructure

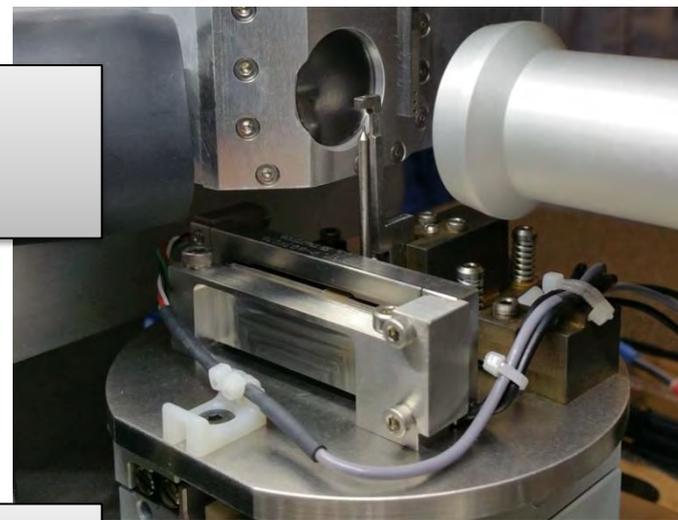

Ultra Load Stage

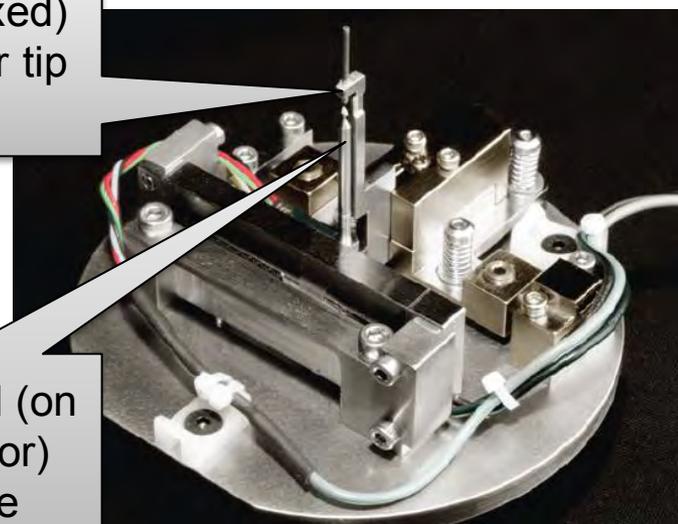

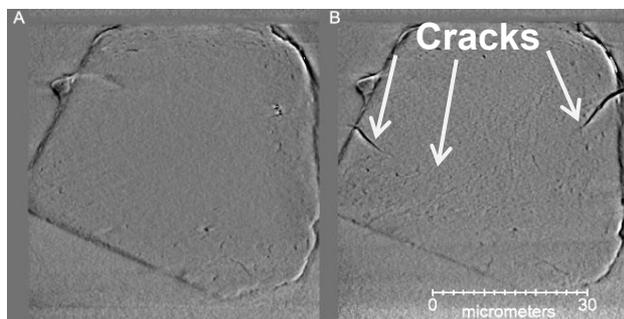

In Situ Nanomechanical Test Stage for Xradia Ultra

Load Stage
installed in
810 Ultra

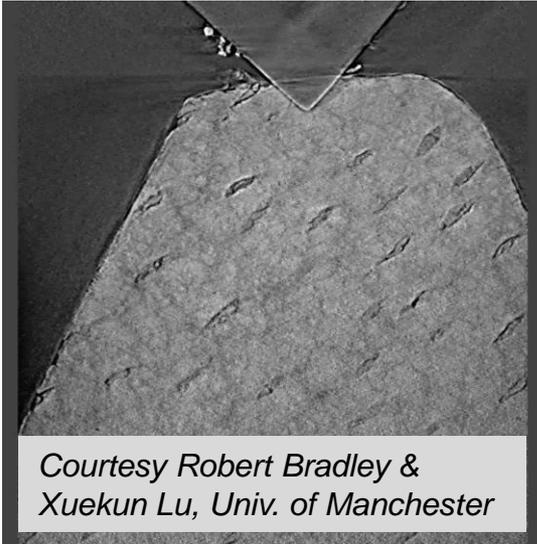

Top anvil (fixed)
with indenter tip
or flat anvil

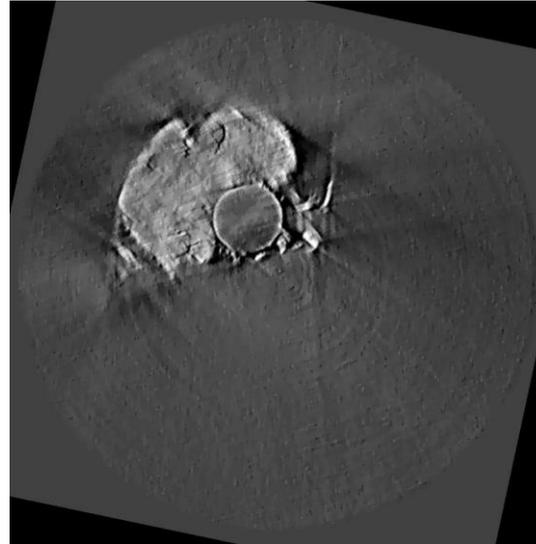

Bottom anvil (on
piezo actuator)
holds sample

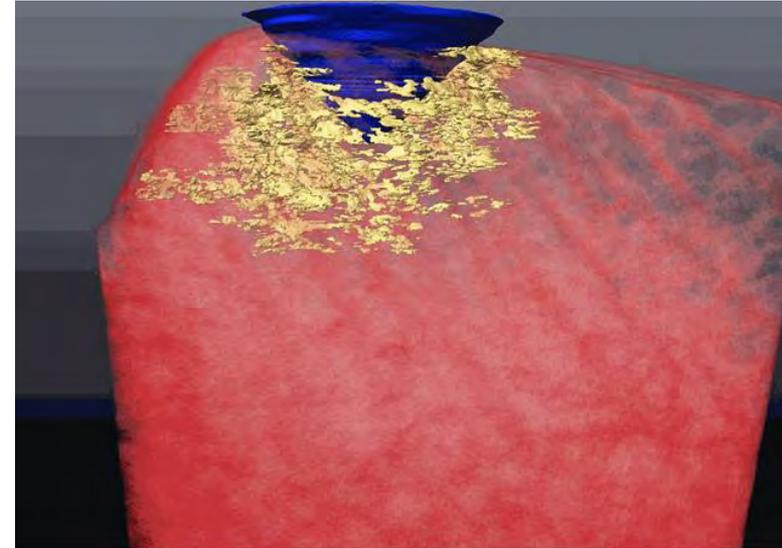

Ultra Load Stage – Indentation: Crack generation and propagation in dentin

Virtual cross section
(vertical)

Virtual cross section
(horizontal)

3D rendering

- Goal to study anisotropic fracture toughness and crack tip shielding in dentin
- Helps development of biomimetic restorative materials and oral treatments
- ***In situ* nanoscale XRM helps understand anisotropic fracture behavior relative to orientation of tubules**

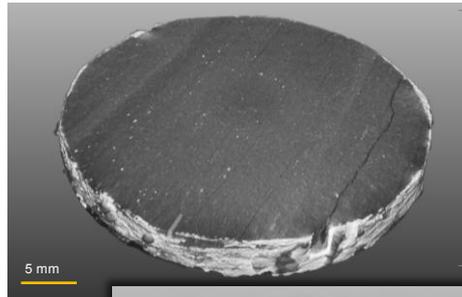

Elephant dentin sample mounted in Load Stage, with diamond indenter mounted above

- **Prospects for DRP comparison**

Raw and segmented FIB-SEM data (30x15x15um @10nm) for calculation of linear elastic stress-strain properties by DRP

Effective Mechanical Properties

Linear stress-strain calculation

The screenshot displays the ElastoDict software interface. The main window shows a 3D visualization of a material structure with a color-coded stress-strain distribution. The structure is composed of various materials, with a central region highlighted in red and white, surrounded by green and yellow regions. The interface includes a menu bar (File, Modules, Interfaces, View, Options, Macro, About, Help) and a status bar at the bottom.

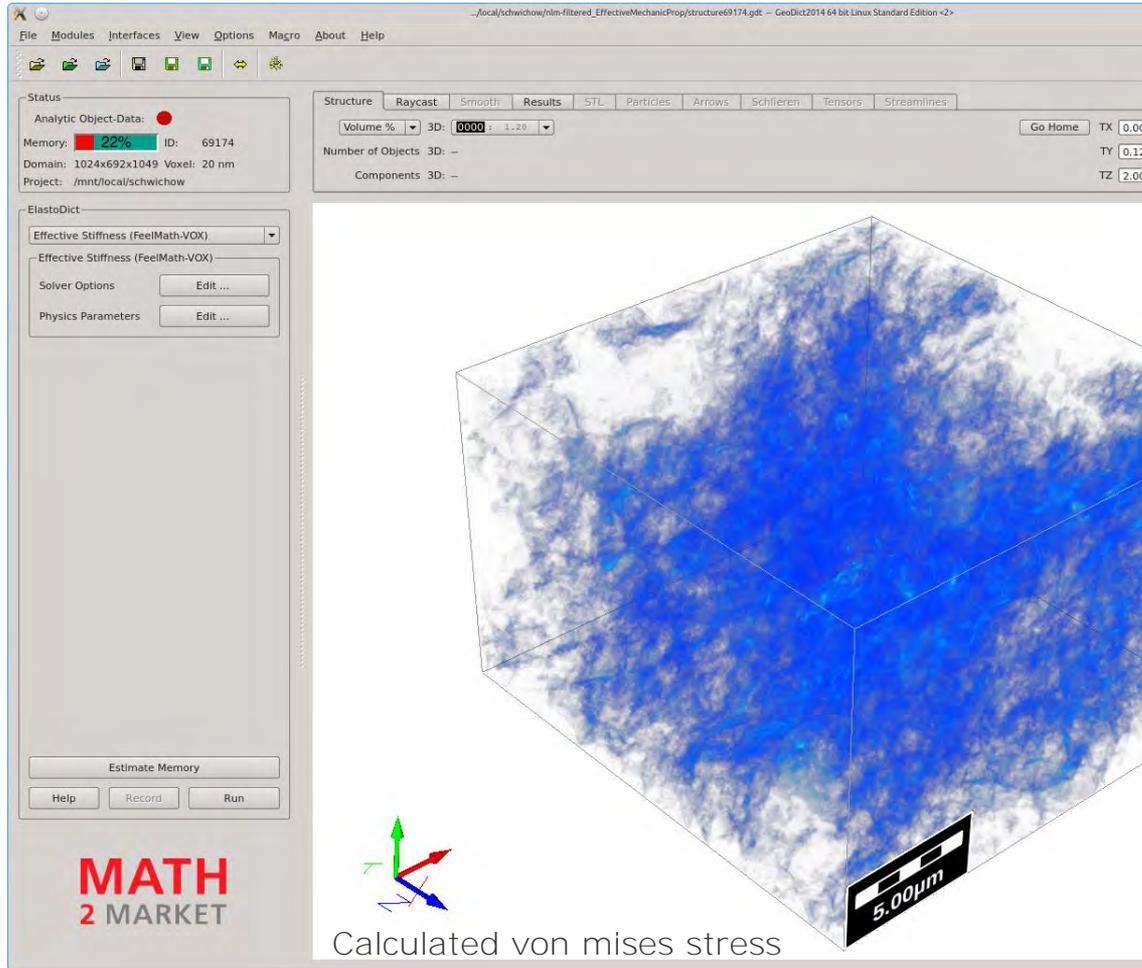

The 'Physics Parameters' dialog box is open, showing a table of material properties. The table lists material IDs, their mechanical properties (E, ν, G, α), and their corresponding material names. The material names are selected from a dropdown menu.

Material	E [GPa]	ν	G [GPa]	α [1/K]	Edit Materials...
Material 0000	Isotropic	5	0.3	0	Organic
Material 0001	Isotropic	5	0.3	0	Organic
Material 0010	Isotropic	67.704	0.318	0	Illit
Material 0011	Isotropic	94.5	0.074	3.2e-07	Quartz
Material 0100	Isotropic	84.546	0.317	0	Calcite
Material 0101	Isotropic	305.172	0.154	0	Pyrite
Material 0110	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 0111	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1000	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1001	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1010	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1011	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1100	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1101	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1110	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual
Material 1111	Isotropic	<input type="text"/>	<input type="text"/>	<input type="text"/>	Manual

The dialog box also includes a 'GeoDict' logo, a 'Math2Market GmbH' logo, and a '1.00µm' scale bar. The main window shows a 3D visualization of a material structure with a color-coded stress-strain distribution. The structure is composed of various materials, with a central region highlighted in red and white, surrounded by green and yellow regions. The interface includes a menu bar (File, Modules, Interfaces, View, Options, Macro, About, Help) and a status bar at the bottom.

- We have successfully measured the strain response at the 65 nm voxel (150 nm resolution) level using a laboratory X-ray Microscope via a series of applied, increasing in situ stresses causing plastic deformation and fracture (at the final load condition)
- Although more thorough data analysis with DVC (Digital Volume Correlation) algorithms is required, it is clear that this method should be able to extract the actual experimental strain fields of a shale at the 150 nm resolution level, which is sufficient resolution to distinguish the grain structure in detail for many shales
- It should be possible to understand the nano-scale root cause of the stress-strain curve based on physical phenomenon including, for example, grain boundary slip, mineral compression, microfractures, etc...
- With the nano-indentation mode of this in situ cell, it may be feasible to understand the smallest microfractures and their patterns induced by hydraulic fracturing
- Using DRP modelling software, it may be feasible to compare simulation and experimental stress-strain data to calibrate simulation models and to get a better holistic understanding of the shale properties by using both DRP and in situ experiments combined
